## Questions & Answers About earth science final exam study guide

| No | Question | Answer |
|---|---|---|
| 1 | What are the main layers of Earth's structure and their characteristics? | Earth's main layers include the crust (solid outer layer), mantle (semi-solid, viscous layer), outer core (liquid iron and nickel), and inner core (solid iron and nickel). The crust is thin and brittle, the mantle is semi-fluid allowing convection, the outer core generates Earth's magnetic field, and the inner core is extremely hot and solid. |
| 2 | How does the rock cycle explain the formation of different rock types? | The rock cycle describes how rocks transform through processes like cooling and solidification (igneous), weathering and erosion (sedimentary), and heat and pressure (metamorphic). These processes interconnect to produce igneous, sedimentary, and metamorphic rocks over geological time. |
| 3 | What is plate tectonics and what evidence supports this theory? | Plate tectonics is the theory that Earth's lithosphere is divided into large plates that move on the asthenosphere. Evidence includes continental drift, matching coastlines, fossil distributions, seafloor spreading, magnetic striping on the ocean floor, and earthquake and volcano distribution. |

| | | |
|---|---|---|
| 4 | What are the different types of volcanoes and how are they formed? | The main types are shield volcanoes (wide, gentle slopes formed by basaltic lava), composite or stratovolcanoes (steep-sided, formed from alternating layers of lava and ash), and cinder cones (small, steep, built from volcanic cinders). They form from different eruption styles and magma compositions. |
| 5 | How do weathering and erosion shape Earth's surface? | Weathering breaks down rocks through physical, chemical, or biological processes. Erosion transports the weathered material by wind, water, ice, or gravity, leading to the formation of landforms like valleys, deltas, and coastal features. |
| 6 | What is the water cycle and why is it important? | The water cycle describes the continuous movement of water through evaporation, condensation, precipitation, infiltration, runoff, and transpiration. It is vital for distributing freshwater, supporting ecosystems, and maintaining climate stability. |
| 7 | How do fossils provide evidence for Earth's past environments and life forms? | Fossils reveal information about ancient organisms, their environments, and geological time periods. They help scientists understand evolution, past climates, and plate movements by analyzing fossil types, distributions, and the strata in which they are found. |
| 8 | What role does Earth's atmosphere play in climate and weather patterns? | Earth's atmosphere regulates temperature, distributes heat via wind, and influences weather patterns through processes like convection, humidity, and pressure systems. It also protects life from harmful solar radiation. |
| 9 | What are natural resources, and how can their use impact Earth's environment? | Natural resources include minerals, water, air, soil, and fossil fuels. Their extraction and consumption can lead to environmental issues like pollution, habitat destruction, and resource depletion, emphasizing the need for sustainable practices. |
| 10 | How can human activities influence geological processes and Earth's systems? | Human activities such as mining, deforestation, urbanization, and pollution can accelerate erosion, cause earthquakes (through geothermal energy extraction), and impact climate change, thereby affecting Earth's natural systems and processes. |
