Core Components of the LRFD Methodology

Understanding Load and Resistance Factors

The LRFD approach centers on applying factored loads and resistances to ensure that bridges can accommodate extreme events with an acceptable level of safety. The main components

include:

1. **Factored Loads:** These include dead loads (self-weight of the structure), live loads (traffic, pedestrians), environmental loads (wind, seismic, temperature), and special loads (impact, construction loads).
2. **Resistance Factors:** These are safety factors applied to material strengths and structural components, accounting for uncertainties in material properties and construction quality.

Design Process Using LRFD

The process involves:

1. Calculating the factored load effects based on the applicable load models.
2. Determining the nominal strengths of structural components.
3. Applying resistance factors to obtain the factored resistances.
4. Ensuring that the factored load effects do not exceed the factored resistances, thereby satisfying safety criteria.
