What Are Weathering and Erosion?

Before diving into the specifics of worksheets, it’s important to clarify what weathering and erosion entail.

Weathering

Weathering refers to the natural breakdown or decomposition of rocks and minerals at or near Earth's surface. It occurs through

physical, chemical, or biological processes, gradually transforming solid rock into smaller particles such as soil, sand, or clay. Types of Weathering: - Physical (Mechanical) Weathering: Disintegration of rocks without chemical change, caused by factors like freeze-thaw cycles, thermal expansion, and abrasion. - Chemical Weathering: Alteration of the rock's mineral composition through chemical reactions, often involving water, acids, or oxygen. - Biological Weathering: Breakdown caused by living organisms, such as plant roots growing into cracks or burrowing animals.

Erosion

Erosion is the process by which weathered materials are transported from one location to another by natural agents such as water, wind, ice, or gravity. Erosion shapes landscapes by removing soil and rock, forming valleys, cliffs, and other geological features. Agents of Erosion: - Running water (rivers, streams) - Wind - Glaciers - Gravity (mass wasting)
