Common Quizlet Questions and Answers for AP Biology Chapter 19

Below are some typical questions from Quizlet sets related to Chapter 19, along with comprehensive answers to aid in understanding.

1. What is the definition of evolution in biological terms?

Answer: Evolution is the change in the genetic composition of a population over successive generations. It results in the development of new species and the diversity of life observed today. Evolution occurs through mechanisms such as natural selection, genetic drift, gene flow, and mutation.

2. Who is Charles Darwin and what is his significance in the study of evolution?

Answer: Charles Darwin was a naturalist whose observations during the voyage of the Beagle led him to formulate the theory of natural selection. His work provided the first robust explanation for how species change over time and

emphasized the importance of adaptation to environmental pressures.

3. What are the main pieces of evidence supporting evolution?

Answer: The main evidence includes: - Fossil record: shows gradual changes over geological time. - Biogeography: distribution of species across different regions. - Homologous structures: similar structures in different species due to common ancestry. - Molecular biology: similar DNA and protein sequences among related species. - Embryology: similar stages of development in different organisms.

4. Explain the concept of natural selection.

Answer: Natural selection is the process where individuals with advantageous traits are more likely to survive and reproduce. Over time, these traits become more common in the population. It relies on variation, differential survival, and reproductive success.

5. What is the Hardy-Weinberg equilibrium and why is it important?

Answer: The Hardy-Weinberg equilibrium describes a state where allele and genotype frequencies in a population remain constant from generation to generation in the absence of evolutionary influences. It provides a baseline to detect if and how evolution is occurring.

6. List and describe the mechanisms that cause evolutionary change.

Answer: - Natural selection: differential survival and reproduction based on heritable traits. - Genetic drift: random fluctuations in allele frequencies, especially in small populations. - Gene flow: movement of alleles between populations through migration. - Mutation: changes in DNA sequences that introduce new genetic variation.

7. Define speciation and describe how it occurs.

Answer: Speciation is the formation of new and distinct species from a common ancestor. It occurs when populations become reproductively isolated, preventing gene flow, and diverge genetically through processes like allopatric or sympatric speciation.

8. What is adaptive radiation?

Answer: Adaptive radiation is the rapid evolution of multiple species from a common ancestor, often when new habitats become available or following mass extinctions. It results in increased biodiversity.

9. How does molecular biology support evolution?

Answer: Molecular biology shows that related species share similar DNA sequences and protein structures, indicating common ancestry. Molecular clocks estimate divergence times based on mutation rates.

10. What role does genetic variation play in evolution?

Answer: Genetic variation provides the raw material for evolution. Without variation, populations cannot adapt to changing environments, making them vulnerable to extinction.

In-Depth Explanation of Key Concepts

Natural Selection

Natural selection acts on phenotypic variation within a population. Traits that enhance survival and reproduction become more common over generations. This process can lead to adaptation, where populations become better suited to their environments. Types of natural selection: - Directional selection: favors one extreme phenotype - Stabilizing selection: favors intermediate phenotypes - Disruptive selection: favors both extremes

Genetic Drift and Population Size

Genetic drift refers to random changes in allele frequencies, which can have significant effects in small populations. It may lead to the loss of genetic variation and can cause certain alleles to become fixed or lost entirely.

Gene Flow and Its Effects

Gene flow occurs when individuals or their gametes move between populations, introducing new alleles. This process can reduce genetic differences between populations and increase genetic diversity.

Mutation as a Source of Variation

Mutations are random changes in DNA sequences. While most are neutral or deleterious, some can confer advantages that natural selection can act upon, leading to evolutionary change.

Speciation Mechanisms

Speciation requires reproductive isolation, which can be geographic (allopatric) or reproductive (sympatric). Over time, genetic divergence leads to the emergence of distinct species.
